AMENDMENTS TO THE CLAIMS:

This listing of claims will replace all prior versions, and listings of claims in the application:

LISTING OF CLAIMS:

1-18 (cancelled)

19. (new): A method for packaging a flexible hydrophilic intraocular lens, in which:

- the lens is placed on an injection support including an implantation end through which the lens can be slid and ejected for intraocular implantation, said injection support being adapted to receive and carry the lens and to be associated with an injection device including a thruster piston able to push the lens on the injection support towards the implantation end,
- the lens and the injection support are placed in a packaging enclosing a volume of liquid solution for conserving the lens which bathes the lens and keeps it hydrated,

wherein:

- an injection support adapted to receive and carry the lens flat and to carry out folding of the lens prior to ejection of the latter via the implantation end is used;
- the lens is placed flat on the injection support and is immersed in a bath of liquid conserving solution contained in a liquid-tight rigid flask which is closed, and
- the assembly is then steam-sterilized.

20. (new): A method as claimed in claim 19, wherein the rigid flask is placed prior to sterilization in an outer packaging envelope compatible with steam sterilization.

21. (new): A method as claimed in claim 19, wherein an injection support is used which is adapted to carry out the folding by a simple translational movement imparted to the lens when the latter is pushed towards the implantation end.

22. (new): A method as claimed in claim 19, wherein an injection support carried removably by a stopper for closing the rigid flask is used.

23. (new): A method as claimed in claim 19, wherein an injection support is used which is associated with an injection device including a hollow cylindrical body for receiving the thruster piston adapted to slide in a sealed manner in the cylindrical body, wherein the rigid flask and the cylindrical body are adapted to be fixed rigidly and sealingly to one another, the injection support extending in the liquid conserving fluid in the rigid flask, but to be fixed in such a way that they can be separated from one another in order to utilize the injection device to implant the lens.

24. (new): A method as claimed in claim 23, wherein the rigid flask and the cylindrical body are fixed to one another by screwing an end of the rigid flask to the outer wall of the cylindrical body in such a way as to ensure liquid-tightness between the rigid flask and the outer wall of the cylindrical body.

25. (new): A device for packaging and conserving in a sterile condition a flexible hydrophilic intraocular lens, comprising:

- an injection support including an implantation end through which the lens can be slid and ejected for intraocular implantation, said injection support being adapted to receive and carry the lens and to be associated with an injection device including a thruster piston able to push the lens towards an implantation end of the injection support;
- a flexible hydrophilic intraocular lens placed on the injection support;
- a packaging enclosing at least the lens, the injection support and a volume of liquid solution for conserving the lens which bathes the lens and keeps it hydrated,

wherein:

- the injection support is adapted to receive and carry the lens flat and to carry out folding of the lens prior to ejection of the latter via the implantation end;
- the lens is carried flat on the injection support and immersed in a bath of liquid conserving solution contained in a rigid liquid-tight flask which is closed, and
- the assembly is in a sterilized condition.

26. (new): A device as claimed in claim 25, wherein the rigid flask is enclosed in an outer packaging envelope compatible with steam sterilization.

27. (new): A device as claimed in claim 25, wherein the injection support is adapted to carry out the folding by a simple translational movement imparted to the lens when the latter is pushed towards the implantation end.

28. (new): A device as claimed in claim 26, wherein the injection support is adapted to carry out the folding by a

simple translational movement imparted to the lens when the latter is pushed towards the implantation end.

29. (new): A device as claimed in claim 25, wherein the injection support is carried removably by a stopper for closing the rigid flask.

30. (new): A device as claimed in claim 25, wherein the injection support is associated with an injection device including a hollow cylindrical body for receiving the thruster piston adapted to slide in a sealed manner in the cylindrical body, and wherein the rigid flask and the cylindrical body are adapted to be fixed rigidly and sealingly to one another, the injection support extending in the liquid conserving fluid in the rigid flask, but to be fixed in such a way that they can be separated from one another in order to utilize the injection device to implant the lens.

31. (new): A device as claimed in claim 30, wherein the rigid flask and the cylindrical body are fixed to one another by screwing an end of the rigid flask to the outer wall of the cylindrical body in such a way as to ensure liquid-tightness between the rigid flask and the outer wall of the cylindrical body.

32. (new): A device as claimed in claim 30, wherein it includes means forming an axial stop which prevents premature extraction of the thruster piston from the hollow cylindrical body.

33. (new): A device as claimed in claim 32, wherein the hollow cylindrical body is adapted to form the axial end stop preventing premature extraction of the thruster piston from the hollow cylindrical body.

34. (new): A device as claimed in claim 33, wherein it includes a seal adapted to be interposed between the axial end stop of the hollow cylindrical body and a sealing block of the thruster piston when in its retracted end position in the hollow cylindrical body.

35. (new): A device as claimed in claim 30, wherein it is provided with unlockable means for locking the thruster piston in its retracted end position in the hollow cylindrical body.

36. (new): A device as claimed in claim 35, wherein the thruster piston includes a non-rotationally-symmetrical operating stem, wherein the hollow cylindrical body has an axial end provided with a non-rotationally-symmetrical opening having a shape matching that of the operating stem, and wherein the operating stem is so mounted as to be able to be rotated about its longitudinal axis between a locked position in which it cannot pass through the opening and an unlocked position in which it can pass through the opening.

37. (new): A device as claimed in claim 25, wherein the injection support includes an adapter bush forming a receptacle for the lens, the bush being adapted to be able to

carry and receive different models of lens, and to be mounted in a cylindrical end portion of the injection support.

38. (new): A method as claimed in claim 20, wherein an injection support is used which is adapted to carry out the folding by a simple translational movement imparted to the lens when the latter is pushed towards the implantation end.
